### Remote Switchover of Dual Fuel Equipment:

When the Central Park Temperature reaches the Designated Interruption Temperature for customers with automatic equipment, the Company will remotely switch over the Customer's equipment to an alternate fuel . The Company will endeavor to provide Customers with advance notice of a remote switchover. If there was a remote switch over (even if the Customer had already been switched over because the Local Outside Temperature had already reached the Designated Interruption Temperature), there will be a remote switch over of the Customer's equipment back to natural gas once the Central Park Temperature reaches the Designated Resumption Temperature. If there was no remote switch over, and the Customer's equipment switched over because the Local Outside Temperature reached the Designated Interruption Temperature, the Customer's equipment will be switched back to natural gas once the Local Outside Temperature reaches the Designated Resumption Temperature. .

When the Central Park Temperature reaches the Designated Interruption Temperature for customers with semi-automatic equipment, the Company will remotely activate an alarm at the Customer's site notifying the Customer to manually switchover to an alternate fuel. If the alarm was activated remotely, the Customer may manually switch back to natural gas once the Central Park Temperature reaches the Designated Resumption Temperature for customers with semi-automatic equipment. If the Local Outside Temperature reached the Designated Interruption Temperature and the Designated Interruption Temperature had not been reached at Central Park, the Customer may manually switch back to natural gas once the Local Outside Temperature reaches the Designated Resumption Temperature.

In addition to any remote switchovers caused by temperatures, the Company will conduct an annual system-wide test of Customers served under this Service Classification.
