INTRASTATE ACCESS SERVICE

15. Access Service Interfaces and Transmission Specifications (cont'd)

15.1 Switched Access Service (cont'd)

15.1.1 Local Transport Interface Group (cont'd)

Only certain premises interfaces are available at the Customer designated premises. The premises interfaces associated with the Interface Groups may vary among Feature Groups.

A. Interface Group 1

Interface Group 1, except as set forth in the following, provides two-wire voice frequency transmission at the point of termination at the Customer designated premises. The interface is capable of transmission of voice and associated telephone signals within the frequency bandwidth of approximately 300 to 3000 Hz.

Interface Group 1 is not provided in association with FGC and FGD when the first point of switching is an access tandem. In addition, Interface Group 1 is not provided in association with FGC, FGC or FGC when the first point of switching provides only four-wire terminations.

The transmission path between the point of termination at the Customer designated premises and the first point of switching may be comprised of any form or configuration of plant capable of and typically used in the telecommunications industry for the transmission of voice and associated telephone signals within the frequency bandwidth of 300 to 3000 Hz.

The interface is provided with loop supervisory signaling. When the interface is associated with FGA, such signaling will be loop start or ground start signaling. When the interface is associated with FGC, FGC or FGC, such signaling, except for two-way calling which is E&M signaling, will be reverse battery signaling.
