ACCESS SERVICE

4. SWITCHED ACCESS SERVICE (Cont'd)

4.2 Provision and Description of Switched Access Service Feature Groups (Cont'd)

4.2.2 Entrance Facilities and Direct Trunked Transport (Cont'd)

(A) Description (Cont'd)

(2) DS3 Facility

The DS3 facility provides for the transmission of up to 672 Voice Grade equivalent channels on digital optical equipment and lightwave facilities selected by the Telephone Company. A DS3 Entrance Facility is provided between the customer designated premises or a collocated interconnection location and the serving wire center of the customer premises or a collocated interconnection location. In those instances where the Telephone Company may be unable to provide Entrance Facilities to the serving wire center of the customer premises or a collocated interconnection location, the Telephone Company will provide the service to a mutually agreed upon wire center. Mileage will be measured based on the V&H coordinates of the customer's appropriate serving wire center and not the alternate wire center the customer is actually served from. At the customer premises or a collocated interconnection location, an optical fiber interface and digital optical equipment convert the signal from optical to electrical. A 110 volt AC, 15 amperes, separately fused, non-switched controlled, single power outlet must be provided by the customer at the customer designated premises or a collocated interconnection location. A DS3 Direct Trunked Transport facility may be provided between the serving wire center of the customer designated premises or a collocated interconnection location and an end office, access tandem or Telephone Company multiplexing Hub.
